INFORMATION FOR PATIENTS

Breast cancer in younger women

Young women with breast cancer are often treated aggressively with surgery, chemotherapy, radiotherapy and other systemic (all over) treatments.

This can affect fertility and menopausal status.

Please speak to your breast care nurse, chemotherapy nurse, surgeon or oncologist if you have any questions related to the information below.

Fertility

Having chemotherapy and hormone therapies can affect your ability to become pregnant. This depends on your age and the type of treatment.

As part of your treatment pathway you can be referred to a fertility specialist to discuss if you would be eligible for fertility preservation. It's important to discuss any fertility concerns before you start treatment.

Please see the breast cancer information booklet 'Fertility and breast cancer treatment' for more information.

Early menopause / menopausal symptoms

Some treatments for breast cancer can cause menopausal symptoms.

Menopausal symptoms can continue throughout treatment. Once treatment is completed you may have entered a premature menopause.

Some women find these symptoms manageable; others find they can affect their quality of life.

Please see the breast cancer information booklet 'Menopausal symptoms and breast cancer'.

Sex, pregnancy and intimacy

Pregnancy is not advised during treatments for breast cancer.

If you think you may be pregnant, please discuss this with your doctor or nurse.

Menopausal symptoms from breast cancer can affect your ability to have or enjoy sex. For example, vaginal dryness which can make intercourse painful. Water based lubricants can be purchased from chemists; hormonal based products are not advisable.

Please use barrier contraception (condoms) if having chemotherapy, as chemotherapy can be passed over in the sexual fluids

Please see the breast cancer information booklet 'Sexuality, intimacy and breast cancer'.
