

The benefits of web filtering

Faster network connection

Streaming media sites such as YouTube, internet tv and radio can use a significant proportion of the available bandwidth which can slow the internet connection. Limiting the amount of accessible streaming media should maintain a good internet speed for everyone.

Reduced inappropriate content

Web filters prevent access to content which could compromise the network and spread malware.

Tightened network security

Web content filtering adds a much-needed layer of security to the network by blocking access to sites that raise an alarm.
