

INFORMATION FOR PATIENTS, PARENTS, GUARDIANS AND CARERS

Children undergoing a renal scan

We have been requested by the hospital doctor to arrange an isotope renal scan for your child.

This study is performed in our Nuclear Medicine department and enables us to look at the function of the kidneys.

The aim of this leaflet is to explain what you can expect when you bring your child for a nuclear medicine scan.

What is nuclear medicine?

Nuclear medicine is a method of imaging the body using a gamma camera and using radiopharmaceuticals (radioactive 'dyes').

To look at the function of the body, nuclear medicine uses gamma rays. These are very similar to x-rays except gamma rays are produced by a radiopharmaceutical dye injected into the bloodstream. The radiation dose is kept as low as possible, similar to an x-ray dose, which means it may take quite a long time to create the images.

What should I do if we cannot attend for the appointment?

Please inform us as soon as possible on 01623 622515, extension 3284 or 3205, if your child is unable to attend. A special injection will be prepared for your child's scan, which cannot be used on any other patient.

How do I prepare my child for this scan?

There are no restrictions regarding eating or drinking. If your child is taking any medication, you may continue to give this as normal.

Please leave any valuables at home. You are responsible for all personal items you bring into hospital and the Trust cannot accept responsibility for their loss or damage.

What happens on the day of the appointment?

You will need to take your child to **Ward 25** in the Women's and Children's Centre at King's Mill Hospital. You will need to be on the ward at **8.30am**.

A nurse will put some cream onto your child's hand to numb it; this will take a little while to work. A doctor will then insert a small tube (cannula) into your child's hand.

You will then need to report to the reception desk in the main x-ray department, which is next to the Emergency Department, in time for your child's appointment. From there you will be directed to the Nuclear Medicine department.

We will give your child the dye through the cannula. After the dye has been given, your child will be free to leave the department. You will be given a time to return for the scan, this is usually early afternoon. Your child may eat and drink normally during this time.

When you return, your child will be required to lie on the imaging couch while the scan takes place. The procedure may take up to 30 minutes. The gamma camera will be close to your child, without touching, and they will never be totally enclosed.

Can I stay with my child?

Yes, you may sit with your child during the scan. Your child may also bring their favourite toy with them.

Are there any risks to having a renal scan?

The benefit from the isotope scan outweighs the small risk from radiation. The scan results will allow the consultant to make the correct treatment decision for your child.

How do we get the results?

When the scan is finished no instant diagnosis can be made. The images produced are recorded digitally and reviewed and a report sent to your child's referring clinician. These results will be discussed with you by the referring clinician. If your child has been referred from the hospital and you have not received a follow-up appointment within four weeks please contact your child's consultant's patient coordinator.

If you have any concerns or require more information, please call 01623 622515, extension 3284 or 3205.
