

INFORMATION FOR PATIENTS

Undergoing an isotope gall bladder scan

We have been requested by your consultant to arrange an isotope HIDA scan. This study is performed in our Nuclear Medicine department and enables us to assess the liver's production of bile and the function of the gall bladder.

The aim of this leaflet is explain what you can expect when you come for your nuclear medicine scan.

What is nuclear medicine?

Nuclear medicine is a method of imaging the body using a gamma camera and using radiopharmaceuticals (radioactive 'dyes'). To look at the function of the body nuclear medicine uses gamma rays. These are very similar to x-rays except gamma rays are produced by a radiopharmaceutical injected into the bloodstream.

The radiation dose is kept as low as possible, similar to an x-ray dose, which means that it may take quite a long time to create the images.

What should I do if I cannot attend for the appointment?

Please inform us as soon as possible on 01623 622515, extension 3284 or 3205, if you are unable to attend. A special injection will be prepared for your scan, which cannot be used on any other patient.

Am I suitable for an isotope scan?

Most patients are suitable for an isotope scan. However you **must** contact us on 01623 622515, extension 3284 or 3205 for advice if:

- You are pregnant
- There is any possibility that you may be pregnant
- You are breast feeding
- You weigh over 30 stones (200 kilos).

How do I prepare for this scan?

Do not smoke or have any food on the morning of your appointment.

It is very important that you do not have anything to drink containing fat; this includes milk and milk products. You are allowed:

- Tea without milk
- Coffee without milk
- Fruit juice or dilute squash
- Water.

If you are taking any medication, you may continue to take this as normal.

Please leave any valuables at home. You are responsible for all personal items you bring into hospital and the Trust cannot accept responsibility for their loss or damage.

What happens on my appointment day?

You will need to report to the reception desk in the original x-ray department, which is adjacent to A&E. From there you will be directed to the nuclear medicine department.

You will be given an injection into a vein in the arm and be required to lie on the imaging couch for approximately two hours while the scan takes place. The gamma camera will be close to you, without touching, but you will never be totally enclosed.

Are there any risks to having an isotope scan?

The benefit from the isotope scan outweighs the small risk from radiation. The scan results will allow your consultant to make the correct treatment decision for you.

To avoid babies and children being exposed to unnecessary radiation, it is good practice to avoid prolonged contact with them for at least 12 hours following the injection.

Can I drive after my scan?

Yes, there is no restriction on driving after your scan.

How do I get the results?

When your scan is finished no instant diagnosis can be made. The images produced are recorded digitally and reviewed and a report sent to your referring clinician.

These results will be discussed with you by your referring clinician. If you have been referred from the hospital and have not received your follow-up appointment within four weeks please contact your consultant's patient coordinator.
